Project Authorization

This agreement for professional services (this “Agreement”) is made and entered into as of this (today's date), (the “Effective Date”), by and between build/create studios or "Client", located at 3055 Miller Rd, Ann Arbor, MI 48103, USA and White Label IQ or "Developer", a Colorado-based Digital Services Company (“White Label IQ” or “we”), 6853 N. Franklin, Ave., Loveland, CO 80538.

The tasks required to complete this project will follow the outlined timelines and deliver the components at the agreed price listed below.

Project Background

White Label IQ will develop a B2B ecommerce website for Midwest Military Fasteners <http://www.mwmilitary.com/>, a supplier of military-grade fasteners and hardware products. The platform will provide existing customers with a fast and efficient way to search for products, place orders, manage accounts, and access product-related documentation.

Unlike a traditional ecommerce website focused on product browsing, this solution will function as a streamlined digital catalog and ordering system where customers can quickly locate products by part number, review product information, and complete purchases with minimal steps. The platform will also support customer-specific purchasing workflows, including quantity-based pricing, tax-exempt accounts, compliance certifications, and approved Purchase Order (PO) / Net 30 payment options.

Project Objectives

The primary objectives of this project are to:

- Develop a modern B2B ecommerce platform that allows customers to quickly search for and purchase military fasteners and related products online.
- Create a streamlined ordering experience focused on fast product discovery and efficient purchasing workflows for existing business customers.
- Enable customers to search products by part number, product name, and other relevant criteria to quickly locate required items.
- Support quantity-based pricing structures and customer-specific purchasing requirements.
- Provide approved customers with access to specialized purchasing options, including Purchase Order (PO) and Net 30 payment methods.
- Implement tax-exempt account management, including document uploads, approval workflows, and expiration tracking.
- Provide customers with access to product-related specifications and certifications associated with their purchases.
- Improve operational efficiency by reducing manual processes related to order management, customer documentation, and compliance-related requirements.
- Deliver a scalable platform capable of supporting future business growth, expanded product catalogs, and additional functionality enhancements.

Design

Design Responsibility

- The visual design for this project is the responsibility of build/create studios.
- build/create studios will deliver approved [Figma design files](#) — including all page templates, component states, responsive layouts, and interaction specifications — prior to WLIQ beginning frontend development.
- WLIQ's responsibility is the pixel-accurate implementation of those approved designs as a production-ready Next.js (React) application.
- WLIQ will not produce original design concepts or make independent visual design decisions.
- Any design changes identified during development will be flagged to build/create studios for resolution before implementation proceeds.

Page Templates to Be Implemented

WLIQ will implement the following page templates as provided in the approved Figma files from build/create studios. Each template will be developed as a reusable Next.js component and applied across all relevant pages.

1. Homepage
2. Part Category / Series Listing (table view)
3. Single Product Page
4. Cart (flyout + full cart page)
5. Checkout
6. Login / Create Account
7. My Account Pages
8. About
9. Quality
10. Contact Us

Note: The cart and checkout process pages will be created using the standard WooCommerce templates.

Responsive Design

All approved designs will be created with responsive behavior in mind to ensure an optimized viewing experience across desktop, tablet, and mobile devices.

NOT included

- 3D renders – The creation of new 3D renders if needed, will be provided through a separate agreement.
- Photo manipulation, composing, and modifications are not included.

Scope of Work

Development

The development environment will be set up on Pantheon (client's provided), configured for a headless WordPress/WooCommerce + Next.js architecture. WordPress serves exclusively as the backend — managing the product catalog, orders, customer accounts, and WooCommerce checkout logic. All customer-facing pages are built in Next.js (React), which consumes the WooCommerce REST API. This replaces the WordPress theme entirely and delivers the fast, performance-first experience required for MMF's industrial B2B audience.

Additionally, necessary plugins will be added to enhance the site's security and performance. This will involve installing a security plugin to protect against malware and other potential threats, as well as plugins to improve the site's speed, such as a caching plugin to enhance page load times.

CMS Pages Development:

Based on the project, here are the CMS-managed pages:

- Homepage
- About
- Quality
- Terms & Return Policy
- FAQs
- Contact Us

All remaining pages — including cart, checkout, and customer account pages — will use WooCommerce's default page templates, styled to match the approved design. No custom development will be done for these pages from scratch.

Features & Functionality

Product Catalog Management

- White Label IQ will configure and develop a centralized product catalog management system that allows administrators to efficiently manage product information through the website's administrative interface.
- The product catalog will support:
 - Product categories and subcategories
 - Product detail pages
 - Product names and descriptions
 - Product SKUs and part numbers
 - Product pricing
 - Inventory quantities
 - Product specification documents and PDF attachments
- As part of the initial implementation, White Label IQ will import approximately 2,500 products using a client-provided spreadsheet. The catalog is expected to scale to 5,000–10,000 products over time.
- The spreadsheet must contain all required product information, including product names, descriptions, pricing, inventory levels, images, and supporting documentation where applicable.
- A tooltip will be displayed on the package quantity column in the part series table, clarifying that the quantity value represents the number of units per package, not the available inventory count.

Product Search

- Search functionality is a critical component of this platform and will be developed to support the needs of business customers who typically know the products they need before visiting the website.
- A full-catalog search bar will be prominently displayed in the header and accessible from every page on the site.
- As the user types, autocomplete suggestions will appear in a dropdown. Results are structured in two levels: the first result will be the matching part series, linking to the catalog or series listing page; individual part number matches follow below, each linking directly to the corresponding product page.

- Selecting a result navigates the user directly to the relevant part series listing or product page. Search functionality will include:
 - Product keyword search
 - Product name search
 - Search results
- An inline table filter allows users to narrow results within the current part series without leaving the page. Pagination or load-more functionality will be implemented to handle large result sets

Customer Account Management

- The website will provide customer account functionality that allows users to create and manage their accounts, access order information, and streamline future purchases.
- Registered users will have access to a customer account dashboard where they can manage account information and review previous transactions.
- This functionality is intended to improve the overall customer experience while supporting repeat purchases and long-term customer relationships.

Ecommerce & Checkout Functionality

- The platform will provide complete ecommerce functionality to support online purchasing and order management. Customers will be able to add products to a shopping cart, review their selections, and complete purchases through a secure checkout process.
- The ecommerce functionality will include:
 - Shopping cart management
 - Secure checkout process
 - Order review and confirmation
 - Customer order history
 - Automated order confirmation notifications
 - Transactional email communications
- Login is required to place any order. Guest checkout is not supported.
- Product pricing is hidden from unauthenticated users. Customers must be logged in to view pricing information.
- The checkout process will be designed to minimize friction while maintaining the information required to process customer orders accurately.

Quantity-Based Pricing

- The website will support package-quantity-based pricing structures for products.
- Pricing will automatically adjust based on predefined package quantity thresholds configured for each product.
- The pricing model will support:
 - Standard package quantity pricing
 - Multi-tier quantity pricing
 - Automatic pricing adjustments based on purchasing quantity
- Current pricing tiers are anticipated to include:
 - 1 Package
 - 3 Packages
 - 5 Packages
 - 10 Packages
- Final pricing rules and product-specific pricing structures will be provided by the Client.

Purchase Order & Net 30 Payment Terms

- The website will support Net 30 purchasing for approved customer accounts.
- Administrative users will be able to designate specific customer accounts as eligible for Net 30 purchasing. Only approved customers will have access to this payment option during checkout.
- This functionality will include:
 - Administrative customer approval
 - Customer-specific Net 30 access
 - Restricted payment method visibility
 - Net 30 checkout option for approved accounts
- The Net 30 functionality will be implemented using the ecommerce platform's payment configuration and customer permission controls.
- The Net 30 payment method will be implemented by repurposing WooCommerce's native Cash on Delivery (COD) payment option, renamed to Net 30.
- Visibility of this payment method at checkout will be restricted to customer accounts that have been manually flagged as eligible by an administrator.
- Customers without this flag will not see the Net 30 option.

Product Spec Sheets vs. Certifications

- **Spec Sheets**
 - Each product may have an associated spec sheet uploaded as a PDF meta field on the product.
 - Spec sheets are freely available for download directly from the product page.

Product Certifications

- Certifications (including MFR C of C, Material Certs, Process Certs, and Test Reports) are available as a free digital add-on at the time of purchase only.
- During checkout, customers may opt in to receive certifications for each eligible product. When opted in, the certification is automatically added to the cart at \$0.00 as a WooCommerce digital product.
- Upon order completion, the certification files are delivered to the customer via email.
- Customers who opted in at the time of purchase may re-download their certifications from their order history.
- Certification requests for past orders where the customer did not opt in at the time of purchase are out of scope for this project.

Shipping & Order Fulfillment

- The website will integrate with Shippo to support shipping calculations, label generation, shipment tracking, and fulfillment workflows.
- Shipping functionality will include:
 - Real-time shipping estimates
 - Shipping carrier integrations
 - Shipping label generation
 - Shipment tracking functionality

Payment Processing

- Stripe will be integrated to support secure online payment processing. Payment functionality will include:
 - Credit card payment processing
 - Secure checkout
 - SSL-protected transactions
 - Payment testing prior to launch
- Merchant account setup and payment processing fees remain the responsibility of the Client.

Tax Exemption Management

- The platform will support tax exemption management for qualifying business customers.

- Customers will be able to submit and manage tax exemption documentation through their account area. Submitted documentation will require administrative review and approval before tax-exempt purchasing privileges become active.
- Tax exemption functionality will include:
 - Tax exemption certificate upload at registration
 - Certificate expiration date entry
 - Administrative approval workflow
 - Administrative rejection workflow
 - Tax exemption status management
 - Automated expiration reminder emails
- During the administrative review period, the customer's account remains fully active. The customer may browse and place orders but will be charged applicable sales tax until their exemption is approved.
- A notice will be displayed at checkout informing the customer of their pending exemption status.
- Approved customers will have sales tax excluded from checkout calculations based on their approved exemption status.

Email Notifications & Communications

- The platform will generate automated transactional communications related to customer accounts and orders.
- Email functionality will include:
 - Customer registration emails
 - Password reset emails
 - Order confirmation emails
 - Shipping notifications
 - Account-related notifications
 - Product certificate delivery emails where applicable

Website Administration & Reporting

- Administrative users will have access to backend tools for managing products, customers, orders, tax exemptions, pricing, and website operations.

- Administrative functionality will include:
 - Product management
 - Category management
 - Customer account management
 - Order management
 - Inventory updates
 - Pricing management
 - Basic ecommerce reporting available through the selected platform

Project Inclusions

Plugins

In addition to the theme-required plugins, White Label IQ will use the following plugins as required to facilitate various functionality. We will select plugins that are widely supported or determine the best selection that meets project requirements. Licensing fees for paid plugins will be the responsibility of build/create studios.

- **WooCommerce** — ecommerce platform (product catalog, orders, checkout, customer accounts) (Free)
- **Stripe** — credit card payment gateway
- **TaxJar** — automated sales tax calculation
- **Shippo** — shipping rates, label printing, carrier integration (UPS, FedEx, USPS)
- **Wordfence (Free Version)** – Basic security and firewall protection (**Free**)

Additional Notes:

- build/create studios is responsible for providing valid licenses for all paid plugins before the development phase begins. Failure to provide licenses may result in project delays.
- Plugin updates and compatibility checks are not included in the initial build scope unless explicitly agreed upon as part of a maintenance plan.

Quality Assurance

Our QA test engineers conduct a functional and Integration assessment to ensure that all functionalities are working as required.

Responsive Testing

We will test each page for functionality, accessibility, and browser compatibility for mainstream browser releases up to 1 year old in major desktop browsers including those made by Apple (Safari), Google (Chrome), Microsoft (Edge), and Mozilla (Firefox.) We won't test in older versions unless agreed separately. If you need an enhanced design for an older browser or specific device, we will provide a separate estimate. The site will also be tested to ensure its pages function properly when viewed on mainstream mobile devices up to 1 year old.

Feedback and Revisions

build/create studios acknowledges and agrees that the feedback and revision process will consist of two structured review rounds. All feedback and proposed amendments shall be communicated through our designated collaboration-based feedback platform, primarily BugHerd, in the interests of consolidating requests and maintaining transparency. Meetings for the provision of additional verbal guidance and direction may be arranged as necessary.

Revision rounds shall be constituted as follows:

- We will set up a staging environment and the URL shall be issued for review by the clients.
- build/create studios's team shall assemble feedback and submit it within a predefined time frame.
- Our team will address the feedback, effectuate the required modifications, and resolve any identified issues.
- A revised review URL shall subsequently be released for review.

Completion of this review process should result in the refinement of the website into its final form. Any additional rounds of review beyond the stipulated round may necessitate a separate agreement and may be subject to additional costs.

Website Security

Following are the security measures implemented during and post-launch to ensure cohesive security of the site:

- Use the Latest PHP Version
- Encourage Clever Usernames and Passwords
- Ensure the Latest Versions of WordPress and plugins at launch
- HTTPS – SSL Certificate
- Installation of The Free Version of WordFence
- Hardening wp-config.php
- Disable XML-RPC
- Hide WordPress Version

Website Administrative Guide

A digital copy of the website's Administrative guide will be provided if requested prior to launch.

Support

Project-related administrative and technical support is included for the duration of the project and extends for 30 days after launch. See additional terms described in the Terms & Conditions below.

Optimization and Performance

Best practices will be used to ensure the site is optimized for page load speed. No specific speeds are guaranteed as choices for images, tracking scripts, plugins and other requirements for the site development will affect the site load times and are not controllable by White Label IQ.

Standard Inclusions:

- Use a CDN to reduce latency if service is provided within the website hosting or the client.
- Simplify code to make fewer HTML requests
- Compression of Image assets
- Minify JavaScript and CSS by removing unnecessary characters from code to reduce its size and improve load time
- Move stylesheets to the top and scripts to the bottom of the page to speed up download and page display.
- Compress components with gzip

Project Deliverables

No.	Deliverable Name	Provided By	Scope	Comments
1.	Scope of Work	White Label IQ	Scope of Work	Mentioned in this Agreement
2.	Website Requirements	White Label IQ	Details of Website Requirements in written	Provided in this Agreement
3.	Required credentials and server access	build/create studios	Credentials for where the website will be hosted	Must receive prior to development
4.	Branding Guidelines	build/create studios	Instructions and directions to be submitted to WLIQ via email or via a file transfer	Must receive prior to development
5.	Website Design mockups/ Wireframes	build/create studios	Figma files based on supplied theme templates	Received
6.	Sitemap	build/create studios	The sitemap will be implemented to facilitate the gathering of necessary website assets.	Must receive prior to development
7.	Website Assests	build/create studios	Images, copy, graphics, SEO Meta will be submitted.	Must receive prior to development

8.	Website deployed to Staging Environment for Client Review and Testing	White Label IQ	Structured review rounds apply here	
9.	Website Deployed on client's Selected Server	White Label IQ	Completed website package delivered to build/create studios	
10.	Source Code	White Label IQ	Source to be handed to build/create studios with full IPR to use, redistribute, modify it after fulfilment of commercial liabilities.	
11.	Digital Administrative Documentation	White Label IQ	Online documentation to administer the website provided to build/create studios	

Project Assumptions

1. The website will be developed using the approved Headless WooCommerce and react architecture.
2. The Client will provide all required content, product information, pricing data, product specifications, images, PDF documents, certifications, and other assets required for implementation.
3. White Label IQ will import the initial product catalog using a structured spreadsheet provided and approved by the Client.
4. The product import estimate is based on the current understanding of the data structure as provided in the preliminary spreadsheet.
5. Product data provided by the Client will be complete, accurate, and formatted according to the import requirements supplied by White Label IQ.
6. The Client will provide and maintain active accounts for Stripe, TaxJar, Shippo, Pantheon hosting, and any other third-party services required for the project.
7. Any fees associated with third-party software, plugins, subscriptions, APIs, hosting, payment gateways, shipping services, tax services, or email delivery services are the responsibility of the Client.
8. Tax exemption approvals and ongoing certificate management will be performed by the Client through the website administration area.
9. Product certifications and specification documents will be provided by the Client in digital format prior to implementation.
10. The website will support the functionality specifically outlined within this Scope of Work. Any additional functionality not explicitly documented will require a separate estimate and approval.
11. The Client will provide timely feedback, approvals, and required assets to maintain the agreed project timeline.
12. Website launch is dependent upon timely receipt of all required content, approvals, third-party account access, and testing sign-offs from the Client.

Out of Scope

1. Custom ERP, CRM, accounting software, inventory management system, or warehouse management system integrations.
2. Integration with proprietary supplier, manufacturer, distributor, or procurement systems.
3. Product data cleansing, enrichment, restructuring, or manual product data entry beyond the agreed product import process.
4. Post-purchase certification requests for orders where the customer did not opt in to receive certifications at the time of purchase. Customers who opted in during purchase may re-download their certifications from order history at no additional charge.
5. Ongoing product management, inventory updates, pricing updates, content updates, or catalog maintenance after launch.
6. Development of custom mobile applications for iOS or Android devices.
7. Multi-language or multilingual website functionality.
8. Multi-currency ecommerce functionality.
9. Large-scale URL migration planning, advanced SEO redirect mapping, or redirect implementation beyond standard website launch requirements.
10. Ongoing security monitoring, vulnerability management, software updates, plugin updates, hosting management, or maintenance services after launch unless covered under a separate maintenance agreement.
11. Custom shipping carrier integrations beyond the selected shipping platform integration.
12. Data migration, implementation, or synchronization with external inventory databases.
13. Accessibility remediation, ADA certification, or WCAG compliance auditing unless specifically stated elsewhere in this Scope of Work.
14. Any functionality, integration, workflow, automation, report, dashboard, or feature not specifically identified within this Scope of Work.

Change Order

Once the PA is approved, any changes to the scope of work, timeline, or associated costs must be formally documented through a written Change Order. This process ensures transparency, mutual agreement, and appropriate allocation of resources.

What Triggers a Change Order?

The following scenarios will require a formal Change Order during a custom design project:

- **New Page or Layout Requests**
 - Adding extra pages, screens, or design templates that were not included in the original scope.
 - Designing alternate versions for other platforms or devices outside the agreed scope.
- **Major Revisions or Design Direction Changes**
 - Requesting a new design direction after initial concept approval.
 - Submitting significant edits that require redesigning core components (e.g., navigation, hero layout, brand visuals).
- **Exceeding the Revision Limit**
 - If the number of revision rounds exceeds the limit defined in the PA, additional rounds will be subject to a Change Order.

Change Order Process

- Every Change Order will:
 - Clearly describe the requested change and its impact.
 - Specify any adjustments to project fees, milestones, or payment terms.
 - Require written approval by the client before new work begins.

Important Notes

- Verbal requests or informal communication (e.g., email threads, calls) will not be treated as approved unless followed by a signed Change Order.
- Work performed outside the original scope without a documented Change Order may result in delays and additional charges.
- We will not proceed with any new work that deviates from the approved scope without formal agreement via Change Order.
